

Angular 17

Recent improvements that have made it awesome!

Preamble

- Angular is a common choice of web frameworks
(within top 5, according to StackOverflow-surveys)
- Many consider it heavy, verbose, and not that exciting
(comparing earlier versions to NextJS / SolidJS / Svelte / ...)
- Recently, a lot of exciting things were added to Angular
(ex. SSR + hydration / signals / standalone components / Vite / ...)
- The question for today: Can it keep up with the innovations of the JavaScript world?

The plan for the next 30ish minutes

- Demo time!
 - Introduce you to the example-project of today: Tour of Heroes!
 - Dive into version 17 and its developer experience
 - What are the "awesome" features?
 - What things impede you in your work?
 - Look at the performance implications of Angular 17 with SSR + hydration
 - How are the performance characteristics?
 - What can dev tools & lighthouse tell us?

Without further ado:
Demo time!
